Is your host compatible with Joomla or Mambo?

Mambo / Joomla Install Checker

This is mostly a Joomla install checker, but should work as a Mambo checker.

Why would you need to download this?

You don't need to download it, unless you want to take a shortcut to see if Joomla or Mambo can run on your host. Otherwise you're looking at uploading the entire Joomla / Mambo package. This checker is a breakdown of the default install routine and checks for Joomla / Mambo compatibility of your host.

How to use it?

Download the zip file and extract to your local machine. Upload the installchecker.php file to the location you would like to install Joomla / Mambo at. Point your browser to the file on your server and view the results.
